

I'm working on a Python programming problem. The current program below is not working well. Can you help in fixing this program with as few changes as possible? Below I first provide the problem description and then the current buggy program.

Given an integer N , find the number of divisors of N that are divisible by 3.

Buggy Program:

```
class P3_Python_buggy:

    def find_divisors_divisible_by_3(N):
        count = 0

        for i in range(1, N + 1):
            if N % i != 0:
                if i % 3 == 0:
                    count += 1

        return count

    def main():
        n = 36 # Beispielwert
        count = P3_Python_buggy.find_divisors_divisible_by_3(n)
        print(f"Number of divisors of {n} that are divisible by 3: {count}")

if __name__ == "__main__":
    P3_Python_buggy.main()
```

Can you fix the above buggy program? Modify only the code within the function. Make sure that you make minimal possible changes needed to fix the program.

The primary issue with the provided code is the incorrect ordering of the conditions. The code currently checks if a number i is not a divisor of N before checking if it's divisible by 3. This means that even if a number is divisible by 3, it won't be counted if it's not a divisor of N .

To fix this, we need to first check if i is a divisor of N and then check if it's divisible by 3. Here's the corrected code:

```
Python

class P3_Python_buggy:
    def find_divisors_divisible_by_3(N):
        count = 0

        for i in range(1, N + 1):
            if N % i == 0 and i % 3 == 0:
                count += 1

        return count

# ... rest of the code remains unchanged
```

Verwende den Code [mit Vorsicht](#).

This modification ensures that only numbers that are both divisors of N and divisible by 3 are counted, resulting in the correct number of divisors.
