

Currently I'm working on a R programming problem. The current program below contains some bugs. Can you help in fixing these bugs with as few changes as possible? Below I first provide the problem description and then the buggy program.

Given an integer N , find the number of divisors of N that are divisible by 3.

Buggy Program:

```
find_divisors_divisible_by_3 <- function(N) {  
  count <- 0  
  for (i in 1:N) {  
    if (N %% i != 0 && i %% 3 == 0) {  
      count <- count + 1  
    }  
  }  
  return(count)  
}  
  
n <- 36  
count <- find_divisors_divisible_by_3(n)  
cat("Number of divisors of", n, "that are divisible by 3:", count, "\n")
```

Can you fix the above buggy program? Modify only the code within the function; make sure that you make minimal possible changes needed to fix the program.

Show drafts

The given program has two primary bugs:

1. **Incorrect divisibility check:** The condition `N %% i != 0` is incorrect. It checks if i is not a divisor of N . We want to check if i is a divisor of N .
2. **Incorrect counting:** The count is incremented when i is not a divisor of N and i is divisible by 3. This is incorrect. We should increment the count only when i is a divisor of N and i is divisible by 3.

Here's the corrected program with minimal changes:

Code snippet

```
find_divisors_divisible_by_3 <- function(N) {  
  count <- 0  
  for (i in 1:N) {  
    if (N %% i == 0 && i %% 3 == 0) {  
      count <- count + 1  
    }  
  }  
  return(count)  
}
```

Use code [with caution](#).

The only change made was to replace `!=` with `==` in the first condition of the `if` statement. This ensures that the count is incremented only when i is a divisor of N and i is divisible by 3.
