

Copilot

Sure, I can help with that! The issue with your program is that the `findGCD` function does not return the GCD value. To fix this, you need to add a return statement at the end of the `findGCD` function. Here's the corrected version of your program with minimal changes:

```
class P1_Python_buggy:

    def findGCD(A, B):
        while B != 0:
            temp = B
            B = A % B
            A = temp
        return A # Add this line to return the GCD

    def main():
        A = 56
        B = 98

        gcd = P1_Python_buggy.findGCD(A, B)

        print(f"GCD of {A} and {B} is: {gcd}")

if __name__ == "__main__":
    P1_Python_buggy.main()
```

This should fix the issue and correctly print the GCD of the two numbers. Let me know if you need any further assistance!
