I'm working on a Python programming problem. The current program below is not working well. Can you help by giving a hint? Below I first provide the problem description and then the current buggy program.

Given an integer N, find the number of divisors of N that are divisible by 3.

Buggy Program:

```
class P3_Python_buggy:

    def find_divisors_divisible_by_3(N):
        count = 0

        for i in range(1, N + 1):
            if N % i != 0:
                if i % 3 == 0:
                    count += 1

        return count

def main():
    n = 36 # Beispielwert
    count = P3_Python_buggy.find_divisors_divisible_by_3(n)
    print(f"Number of divisors of {n} that are divisible by 3: {count}")

if __name__ == "__main__":
    P3_Python_buggy.main()
```

(1) Can you describe the bug(s) in this program and the required fixes?
(2) Can you provide a concise single-sentence hint about one bug in this program?
The hint should not be too detailed as I want to think about the fixes by myself.
However, the hint should not be too abstract, as I need some help.

Bug Description:

The main bug in the program is in the logic of the `find_divisors_divisible_by_3` method. The condition `if N % i != 0:` is incorrect because it checks for non-divisors of `N` instead of checking for divisors. This prevents the program from correctly counting the divisors of `N` that are divisible by 3.

Hint:

Make sure you are only considering numbers that are divisors of `N` before checking if they are divisible by 3.
