 Gemini Advanced ausprobieren

I'm a student learning the Python programming language. I would like to get some programming excercises.  
I'm not good with string manipulations. Please generate a task that I can use to practice. Don't provide the solution.

Vorschläge anzeigen ▾

### Python String Manipulation Exercise

#### Task:

Given a string that represents a sentence, write a function that returns a new string where:

1. All vowels are removed.
2. All consonants are replaced with their corresponding uppercase letters.
3. The first and last letters of the original sentence are swapped.

#### Example:

- Input: "Hello, world!"
- Output: "HLLWRLD!"

Hint: You might find the `str.replace()` method helpful for this task.
