I'm working on a R programming problem. The current program below is not working well. Can you help by giving a hint? Below I first provide the problem description and then the current buggy program.

Given an integer N, find the number of divisors of N that are divisible by 3.

Buggy Program:

```
find_divisors_divisible_by_3 <- function(N) {  
  count <- 0  
  for (i in 1:N) {  
    if (N %% i != 0 && i %% 3 == 0) {  
      count <- count + 1  
    }  
  }  
  return(count)  
}
```

```
n <- 36  
count <- find_divisors_divisible_by_3(n)  
cat("Number of divisors of", n, "that are divisible by 3:", count, "\n")
```

(1) Can you describe the bug(s) in this program and the required fixes?
(2) Can you provide a concise single-sentence hint about one bug in this program?
The hint should not be too detailed as I want to think about the fixes by myself.
However, the hint should not be too abstract, as I need some help.

Analyzing the Buggy Program

Problem Description

The goal is to count the divisors of a given integer N that are also divisible by 3.

Buggy Program Analysis

The primary issue lies in the condition for incrementing the `count`. The current condition `N %% i != 0 && i %% 3 == 0` is incorrect.

1. `N %% i != 0`: This checks if `i` is not a divisor of `N`. We actually want to find divisors, so this condition should be reversed.

2. `i %% 3 == 0`: This correctly checks if `i` is divisible by 3.

Corrected Program

Code-Snippet

```
find_divisors_divisible_by_3 <- function(N) {  
  count <- 0  
  for (i in 1:N) {  
    if (N %% i == 0 && i %% 3 == 0) {  
      count <- count + 1  
    }  
  }  
  return(count)  
}
```

Verwende den Code [mit Vorsicht](#).

Bug Hint

Hint: The program is incorrectly excluding divisors of N.
