I'm working on a R programming problem. The current program below is not working well. Can you help by giving a hint? Below I first provide the problem description and then the current buggy program.

Given an integer N, find the number of divisors of N that are divisible by 3.

Buggy Program:

```
find_divisors_divisible_by_3 <- function(N) {
 count <- 0
 for (i in 1:N) {
  if (N %% i!= 0 && i %% 3 == 0) {
   count <- count + 1
}
 return(count)
count <- find_divisors_divisible_by_3(n)
cat("Number of divisors of", n, "that are divisible by 3:", count, "\n")
```

(1) Can you describe the bug(s) in this program and the required fixes? (2) Can you provide a concise single-sentence hint about one bug in this program? The hint should not be too detailed as I want to think about the fixes by myself. However, the hint should not be too abstract, as I need some help.

(1) Bug Description and Required Fixes:

The main bug in the program is in the condition inside the `if` statement. The condition `N 2% i != \emptyset is incorrect because it checks if i is not a divisor of N. Instead, it should check if i is a divisor of `N`, so it should be `N %% i == 0`. Additionally, the program should check for divisibility by 3 after confirming that `i` is a divisor of `N`.

(2) Hint:

Ensure that the program correctly identifies divisors of "N" before checking if they are divisible by 3.
